ABSTRAK

Vesicolithiasis yaitu penyakit dimana di dapatkan batu di dalam saluran kemih terutama vesika urinaria, yang dimulai dari kaliks sampai dengan uretra anterior. Insiden tahunan batu kandung kemih mencapai 2,3 kasus per 100.000 (Prihadi.dkk,2014). Penyusunan laporan tugas akhir ini bertujuan untuk menggambarkan pelaksanaan asuhan keperawatan perioperatif dengan tindakan Sistoskopi Litotripsi atas indikasi Vesicolithiasis di RSUD Jenderal Ahmad Yani. Metode yang digunakan pada laporan tugas akhir ini ialah Asuhan Keperawatan yang meliputi pengkajian dengan pengambilan data melalui wawancara, observasi, pemeriksaan fisik terhadap Tn. S kemudian menegakkan diagnose keperawatan, menyusun rencana tindakan keperawatan, melakukan implementasi, dan mengevaluasi tindakan yang telah dilakukan, serta studi dokumentasi. Hasil Asuhan Keperawatan yang dilakukan, ditemukan pasien dengan diagnosa keperawatan nyeri kronis dan ansietas pada fase pre operatif, risiko hipotermia perioperatif pada fase intra operatif, dan gangguan mobilitas fisik pada fase post operatif. Setelah diberikan tindakan keperawatan dan dievaluasi pada tahap pre operatif masalah nyeri dan ansietas teratasi. Tahap intra operasi risiko hipotermia perioperatif tidak terjadi. Tahap post operasi masalah gangguan mobilitas fisik teratasi. Diharapkan perawat untuk lebih teliti dan memahami dalam melakukan asuhan keperawatan perioperatif pada pasien kasus Vesicolithiasi terutama yang akan dilakukan tindakan Sistoskopi Litotripsi.

ABSTRACT

Vesicolithiasis is a disease where stones are found in the urinary tract, especially the urinary bladder, which starts from the calyx to the anterior of urethra. The annual incidence of bladder stones reaches 2.3 cases per 100,000 (Prihadi.dkk, 2014). The preparation of this final report aims to describe the implementation of perioperative nursing care with Cystoscopy Lithotripsy for indications of Vesicolithiasis in the operating room of Ahmad Yani General Hospital. The method used in this final report is Nursing Care which includes assessment by collecting data through interviews, observation, physical examination, then establishing nursing diagnoses, preparing nursing action plans, implementing, and evaluating actions that have been taken, as well as documentation studies. The results of the nursing care carried out, found patients with nursing diagnoses of chronic pain and anxiety in the preoperative phase, the risk of perioperative hypothermia in the intraoperative phase, and impaired physical mobility in the postoperative phase. After being given nursing actions and evaluated at the preoperative stage, pain and anxiety problems were resolved. The intraoperative stage of the risk of perioperative hypothermia does not occur. The postoperative stage of the problem of physical mobility disorders is resolved. Nurses are expected to be more thorough and understand in carrying out perioperative nursing care for patients with vesicolithiasi cases, especially those who will undergo lithotripsy cystoscopy.
