ABSTRACT

Almost 10% in the world have abscesses, especially in developing countries, in Indonesia 14% of the Indonesian population has abscesses, while in Lampung, patients with abscesses range from 5-15% of patients with persistent. Data in the operating room of the Mardi Waluyo hospital in January-April 2022 there were 14 cases with abscesses. The purpose of this report is to describe the implementation of perioperative nursing care in femoral abscess patients with debridement. The method used in this final report uses interviews, observations, physical examinations. When the nursing care was carried out on April 06 - April 08 2022, the location of nursing care was carried out in the operating room and operating room at Mardi Waluyo Hospital, Metro City. It was found that the patient said pain in the left thigh and difficult to move, the preoperative problem was acute pain and impaired physical mobility. In the intraoperative phase, there were problems with the risk of injury. In the postoperative phase, perioperative hypothermia risk problems and impaired physical mobility were found. After being given nursing actions and evaluated at the preoperative stage, the problem of acute pain is resolved. In the intra-operative stage, the risk of injury did not occur. The post-operative stage, the risk of perioperative hypothermia did not occur and impaired physical mobility was resolved. Nurses are expected to be more thorough and understand in carrying out perioperative nursing care in patients with femoral abscesses, especially those who will be debridement.
