ABSTRACT

Scabies is a skin disease caused by the tiny tick *Sarcoptes Scabiei* Variety *Hominis*. Scabies is a problem in tropical and subtropical climates. As many as 0.29% of the population in the east bay of Lampung province are affected by scabies, the most sufferers are students or santri (puskesmas sukamaju, 2021). Based on a preliminary survey at the Pondok Pesantren Yatim, Piatu and dhuafa bahrul ulum al-muyassaroh, 55 children were found to have scabies.

The general objective of this study was to determine the condition of environmental sanitation and the behavior of students related to scabies in the orphan, orphan and du`afa boarding school bahrul `ulum al- muyassaroh. This type of research is descriptive quantitative which describes environmental sanitation and personal hygiene sanitation behavior by taking a quantitative approach to examining personal hygiene in the Orphanage, Orphanage and Du`Afa Bahrul `Ulum Al- Muyassaroh boarding school bandar lampung in 2023. The study population was 55 students, the research sample was the entire population.

From the results of the study obtained the results of clothing hygiene 45.45% TMS towel hygiene 92.72% TMS, hand hygiene 36.36% TMS, skin hygiene 7.27% TMS, and bed hygiene 98.18% TMS. Environmental sanitation such as ventilation area 100% TMS, occupancy density 100% TMS. And the availability of clean water is 100% TMS. Suggestions need handling and counseling from related agencies for scabies.
