ABSTRACT

Breast cancer is a type of cancer that is very dangerous for all women in the world, there are 2.3 million cases of women suffering from breast cancer in the world. 18,150 tumors in Indonesia, there were 179 mastectomy patients from January to November 2023 at Dr. H. Abdul Moeloek Hospital Lampung Province. The purpose of the study was to determine the relationship of family support to body image in postoperative mastectomy patients at RSUD Dr. H. Abdul Moeloek Lampung Province in 2024. This type of research is quantitative, analytical survey method with a cross sectional approach, and the place of research at RSUD Dr. H. Abdul Moeloek Lampung Province. The study population was postoperative mastectomy patients at Dr. H. Abdul Moeleok Hospital Lampung Province. The research sample amounted to 48 respondents. Research time March 18 - April 1, 2024. Research variables of family support on body image. Data analysis in the study using the chi-square test. Based on the results of research that has been conducted on postoperative mastectomy patients at Dr. H. Abdul Moeleok Hospital, Lampung Province, it is found that respondents with a positive body image are 40 respondents (83.3%), negative body image is 8 respondents (16.7%) and good family support is 40 respondents (83.3%), poor family support is 8 respondents (16.7%). It can be concluded that there is a relationship between family support and body image in postoperative mastectomy patients at Dr. H. Abdul Moeloek Hospital Lampung Province with p value = 0.018 (p value <0.05) OR 9,000 95% CI 1,598-50,691. Researchers hope that it can be an input for hospital nurses to be able to provide education to the patient's family to provide better support in order to change the patient's negative body image to positive.
