ABSTRAK

Appendiksitis merupakan inflamasi usus buntu yang berada di ujung sekum. *Appendisitis* dapat terobstruksi oleh massa feses yang keras, yang akibatnya akan terjadi inflamasi, infeksi, ganggren, dan mungkin perforasi. Tujuan penulisan laporan ini menggambarkan asuhan keperawatan perioperatif pada pasien *Appendisitis* dengan tindakan *appendiktomi* di Rumah Sakit Bhayangkara Bandar Lampung. Fase ini meliputi pre operasi, intra operasi, dan post operasi. Metode menggunakan studi kasus fokus pada keperawatan perioperatif. Subjek laporan ini satu orang pasien dengan diagnosa *Appendisitis*. Asuhan keperawatan dilakukan pada 03 – 05 Maret 2022 di Rumah Sakit Bhayangkara Bandar Lampung. Hasil pengkajian didapatkan masalah keperawatan pre operasi: (nyeri karena indikasi *apendicitis*), intra operasi: Resiko perdarahan dan post operasi: hipotermi, kerusakan integritas kulit. Intervensi yang dilakukan manajemen nyeri, manajemen hipotermia, perawatan luka. Evaluasi setelah implementasi tingkat nyeri menurun, tidak terjadi risiko perdarahan, hipotermia post op, tidak ada tanda-tanda infeksi luka. Diharapkan perawat perioperatif dalam memberi askep perioperatif sesuai dengan standar yang berlaku serta mengikuti berbagai pelatihan sehingga menambah pengetahuan dan keterampilan.

ABSTRACT

Appendicitis is an inflammation of the appendix at the end of the cecum. Appendicitis can be obstructed by a hard stool mass, which results in inflammation, infection, gangrene, and possibly perforation. The purpose of this report is to describe perioperative nursing care for appendicitis patients with appendectomy at Bhayangkara Hospital, Bandar Lampung. This phase includes preoperative, intraoperative, and postoperative. The method uses a case study focus on perioperative nursing. The subject of this report is one patient with a diagnosis of appendicitis. Nursing care was carried out on 03 – 05 March 2022 at Bhayangkara Hospital Bandar Lampung. The results of the assessment showed preoperative nursing problems: (pain due to indications of appendicitis), intraoperative: risk of bleeding and postoperative: hypothermia, damage skin integrity. Interventions include pain management, hypothermia management, wound care. Evaluation after implementation decreased pain level, no risk of bleeding, post op hypothermia, no signs of wound infection. It is expected that perioperative nurses in providing perioperative care in accordance with applicable standards and participate in various trainings so as to increase knowledge and skills.
