"THE INFLUENCE OF FOOT MASSAGE ON SLEEP QUALITY OF POST OPERATING CLIENTS INSURGICAL Ward"

Abstract

Republic of Indonesia Health Survey in 2009, based on data from the Ministry of Health's tabulation states that surgery and surgery are ranked 11th.

Operational actions in Indonesia in 2012 reached 1.2 million. The problem that often arises after surgery is a sleep disorder. Foot massage is one of the effective ways to overcome the sleep disorders experienced by the client. This study aims to identify the effect of giving foot massage to the quality of sleep post-operative client's sleep in the Operating Room of RSUDDr. H. Abdul Moeloek Province. Land. The design of this research is quasi experiment with pre test design with post test with control group design.

This type of quantitative research using consecutive sampling techniques. The population in the study were 64 respondents. The analysis used is the dependent and independent t test. The results of this study indicate the average score of sleep quality in the control group post intervention 9.12. Whereas sleep quality in the intervention group was obtained at 4.78 post intervention. A p-value 0,000 was obtained which showed differences in sleep quality scores in the two control groups and interventions given foot massage therapy. So it is recommended that hospitals can include foot massage therapy as an alternative therapy in overcoming sleep disorders in postoperative clients.
