PERIOPERATIVE NURSING CARE FOR INGUINAL HERNIA PATIENTS WITH HERNIAREPAIR OPERATIONS IN ALIMUDIN UMAR HOSPITAL, WEST LAMPUNG IN 2021

(Xiii + 72 pages, 10 tables, 4 attachments)

ABSTRACT

Perioperative nursing care is a careful, precise and accurate service. The patient's condition during surgery has the potential to change health status, so it is important for nursing care to be carried out. A hernia is a protrusion of an organ or structure through the muscular wall of the abdomen. Hernias include subcutaneous tissue which generally consists of skin, according to the World Health Organization (WHO, 2017) 19,173 279 patients (12.7%) with hernias being the most common. Based on data obtained at Alimudin Umar Liwa General Hospital in the month January to July 2021, data obtained from 39 patients had hernias and underwent surgery. If the hernia is not immediately operated on because the intestine is trapped in the inguinal canal and the blood flow is cut off, if not treated immediately, this part of the intestine will die due to lack of blood.

The purpose of this report is to carry out perioperative nursing care for inguinal hernia patients with Herniarepair surgery at Alimudin Umar Hospital, West Lampung. The method used is assessment, interview, observation, physical examination, supporting examination. The subjects in this report are inguinal hernia patients with hernia repair surgery. Nursing care was carried out on July 8, 2021 in the operating room of the Alimudin Umar Hospital, West Lampung. The results of the preoperative nursing report obtained nursing problems. Patient anxiety said that the operation was not going smoothly, looked anxious, and had cold sweats. Anxiety nursing problems were raised in intraoperatively because when the patient entered the operating room, anxiety still occurred with the second diagnosis, namely the risk of injury and postoperative diagnosis, namely the risk of postoperative hypothermia, the patient seemed to shiver and the body felt cold to the touch.
