***ABSTRACT***

*A person suffering from hypertension can experience complications if they do not control their blood pressure or take care of their own health. This research aims to find out how hypertensive patients self-care. This research was designed to use a quantitative descriptive approach and used cross sectional. The population of this study was 100 patients at the Rajabasa Indah Community Health Center. The sampling technique uses a purposive sampling method. Data was taken using the standard Hypertension Self Management Behavior Questionnaire (HSMBQ). The data analysis used is univariate analysis. These results indicate that self-care is in the good category, namely 42.0%.*

*Self care consists of 5 aspects, namely personal integrity, self-regulation, interaction with other health workers, blood pressure monitoring, compliance with recommended rules. The research results obtained were that based on gender, the highest self-care in the good category was found in women, with a percentage of 43.8%. Based on self-care age, the good category is aged 50-59 years. Based on the level of self-care education, the highest good category is in undergraduate education with a percentage of 56.3%. Based on work, the highest result was that respondents did not work with a good self-care category of 43.0%. Based on income, 62.5% have good self-care. Based on the number of drug items, respondents who received <5 drugs had 42.0% good self-care. Based on comorbidities, 42.6% of respondents had good self-care. Based on side effects, 62.5% of respondents had sufficient self-care. Based on the length of time they have suffered from hypertension, respondents with a duration of suffering <1 year have good self-care, namely 60.0%. Based on the history of hypertension in the family, respondents with a history of hypertension had good self-care with a percentage of 42.6%.*
