ABSTRAK

Data Prevelensi hemoroid di Indonesia tahun 2022 adalah 6,1%. Berdasarkan laporan tahunan di Rumah Sakit TK IV 02.07.04 DENKESYAH 02.40.03 Bandar lampung 2023 dari bulan Januari sampai Februari kejadian hemoroid berjumlah 8 orang. Penyakit hemoroid memiliki dampak yang tinggi pada kualitas hidup penderita hemoroidektomi, penting adanya upaya penurunan nyeri. Tujuan penulisan laporan tugas akhir ini adalah memberikan gambaran pelaksanaan asuhan keperawatan gangguan kebutuhan rasa aman nyaman (nyeri) pada pasien post operasi hemoroid di Rumah Sakit TK IV 02.07.04 DENKESYAH 02.40.03 Bandar lampung dengan metode proses keperawatan mulai dari pengkajian, diagnosis keperawatan, rencana keperawatan, implementasi dan evaluasi. Diagnosis keperawatan utama pada post operasi hemoroid adalah nyeri akut dengan intervensi manajemen nyeri seperti melakukan teknik nonfarmakologis (melakukan terapi rendam air hangat/sitz bath), kolaborasi pemberian obat-obatan (Dexketoprofen 25mg/8jam, Anbacim 1gr/12jam, Omeprazol 40mg/12jam, Kalnex 500mg/8jam). Hasil yang didapatkan dari tindakan manajemen nyeri yaitu keluhan nyeri menurun, skala nyeri menurun menjadi 2, meringis menurun, gelisah menurun, dan kesulitan tidur menurun, tekanan darah 120/80 mmHg, nadi 80 kali/menit, pernafasan 20 kali/menit. Saran dari laporan tugas akhir ini diharapkan dapat dijadikan sebagai acuan dalam melakukan proses asuhan keperawatan mulai dari pengkajian sampai evaluasi, baik bagi bidang keilmuan maupun praktisi keperawatan rumah sakit.

ABSTRACT

Hemorrhoid prevalence data in Indonesia in 2022 is 6.1%. Based on the annual report at the Hospital Class IV 02.07.04 DENKESYAH 02.40.03 Bandar Lampung 2023 from January to February the incidence of hemorrhoids was 8 people. Hemorrhoid disease has a high impact on the quality of life of hemorrhoidectomy patients, it is important to make efforts to reduce pain. The purpose of writing this final assignment report is to provide an overview of the implementation of nursing care for disturbances in the need for a sense of safety and comfort (pain) in post-hemorrhoid surgery patients at the Hospital Class IV 02.07.04 DENKESYAH 02.40.03 Bandar Lampung with the nursing process method starting from assessment, nursing diagnosis, nursing plan, implementation and evaluation. The main nursing diagnosis in post-hemorrhoid surgery is acute pain with pain management interventions such as performing non-pharmacological techniques (conducting warm water soaking therapy/sitz bath), collaboration in administering drugs (Dexketoprofen 25mg/8 hours, Anbacim 1gr/12 hours, Omeprazole 40mg/12 hours, Kalnex 500mg/8 hours). The results obtained from pain management actions are decreased pain complaints, pain scale decreased to 2, decreased grimacing, decreased anxiety, and decreased difficulty sleeping, blood pressure 120/80 mmHg, pulse 80 times/minute, breathing 20 times/minute. Suggestions from this final project report are expected to be used as a reference in carrying out the nursing care process from assessment to evaluation, both for the scientific field and hospital nursing practitioners.
